

Project License — GNU GPL v3

A software license is a document that defines the rules for using, modifying, and distributing a project's source code.

It specifies both the rights of users and the obligations related to the use of the application.

The `ft_transcendence` project uses the **GNU GPL v3 (GNU General Public License v3)**.

We chose this license because it:

- protects the open-source nature of the project,
- allows others to improve and develop the application,
- guarantees access to the source code,
- prevents modified versions from becoming closed-source.

The GPLv3 license allows users to:

- use the project privately and publicly,
- copy the source code,
- modify the application,
- redistribute the project.

At the same time, it requires:

- preserving the original authorship information,
 - keeping the same GPLv3 license,
 - providing source code when redistributing the project.
